

# Mobile phones

## 1. Can we choose our own Operating System with the hardware?

Blackberry

Android

Empty Hardware

iOS

Windows

\*\* First users have to buy hardware component. A hardware component which supports multiple operating systems like iOS, android, windows. People can change operating system whenever they don't feel like using the current operating system. And also different versions.

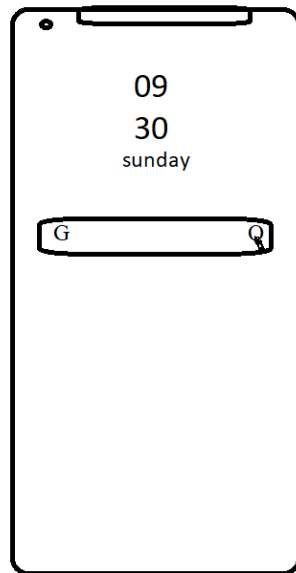

## **2.One mobile data open in anther mobile phone?**

### **Problem Statement:**

My father bought a phone which had 2gb RAM and 32gb ROM it gets hang all the time. It gets heat many of times. It drains battery soon.

\*\*I thought why can't we have a system in which everything should be on cloud.

\*\*And then users can access everything through user interface using credentials

\*\*Let's take few examples, supposed I have lost my mobile. I can just take another and login with my credentials and I can access entire data.

\*\*Another example is that if I am in office and forgot my phone at home and I urgently need to get access to my phone so I ask my colleague to logout n I'll login to mine with his hardware.

## **3.Live map recogniser on lock screen?**

\*\*My friend go somewhere they don't know where he is? On that situation they use goggle maps to find the place.

\*\*That time this software is use full.
